

# Qwertycoin White Paper

QWERTYCOIN (Ticker: QWC) is a digital crypto-currency designed for everyday use. It supports simple CPU/GPU mining and masternode operations, Desktop / Mobile / Web wallets are provided for user's accessibility to QWERTYCOIN across multiple platforms.

## FEATURES

---

- **Anonymous, Unlinkable and Untraceable Transactions** - Based on CryptoNote V2.0 Technology over a decentralized network.
- **Egalitarian Proof of Work (EPoW)** – Through Cryptonight-base algorithm with an implementation of ASIC resistant mining algorithm.
- **Egalitarian Proof of Service (EPoS)** – Through transaction fee distribution among master nodes based on Uptime as a measure of service .
- **Reserve Requirement System** - Development fees and donations collected over time will be stored in QWERTYCOIN Foundation.
- **No Pre-mining** - Community owned system and transparent developments and operations.
- **Free Master Nodes** - No mandatory minimum coin commitment to run Master Nodes.
- **Free Community Faucet** – Free QWC every 24 hours from community donations.
- **Transparent Operations and Management** – All accounts run by community funds can be monitored using tracking keys.

## TECHNICAL SPECIFICATIONS

---

- Total Number of Coins: 184.47 Billion
- Current Target Block Time: 120 seconds -> 20 seconds
- Time for Transaction Hashes: Instant (<4 seconds)
- Core Design: CryptoNote V2.0 – Forked from Bytecoin, Monero + Karbowanek + Digitalnote and Qwertycoin V1.0

## ULTIMATE PROJECT GOALS

---

- Development of User-Friendly Wallet Software for Desktop/Mobile Computers, Web and Mobile Phones
- Q-Life app with chat + wallet + crypto exchange + store locator
- Blocktime Reduction to less than 20 seconds
- Robust Network (< 50 PPM Blockchain Split) with Blockchain/Network Monitoring Tool for all users
- Network Explorer feature that allows monitoring of blockchain
- User Population over 1 million
- E-Commerce/Woo-Commerce Integration + Local Stores as Fiat Exchange

## **Introduction**

---

Qwertycoin (Ticker: QWC) is a real community cryptocurrency, a decentralized digital asset, like Bitcoin. It is based on CryptoNote Technology V2.0. Nobody owns or controls Qwertycoin. It allows anonymous and trustless peer to peer transactions through a fair ASIC-resistant PoW mining algorithm, to avoid centralization.

Qwertycoin transactions are untraceable, unlinkable and your privacy is protected. Mathematics secures the QWC network and empowers individuals to control their own finance and information.

## How to Get Coins [Mining]: Egalitarian Proof of Work (EPoW – Cryptonight Based Variant)

The word egalitarian stands for providing equal rights and equal opportunities. QWC network is an open source and is driven by community members. Anyone can join and support the network and get coins as compensation to their support through mining.

Cryptonote Technology have a built-in block reward system called emission rate. It is a shape of log function and, because of its original design, block rewards diminish in every single block.

QWC block rewards will reduce by each block found and eventually reach a point called 'tail emission'. QWC has an emission factor of 19.

### ● History of Mining Algorithm Changes

	Date	Block Height	From	To	Supporting Mining Equipment and Service
Initial		0	Cryptonight	-	CPU, GPU, FGPA, ASIC, Nicehash
1 <sup>st</sup> Change		120,000	Cryptonight	Cryptonight- Heavy	CPU, GPU / The rest are penalized.
2 <sup>nd</sup> Change	T.B.D.	T.B.D.	T.B.D.	T.B.D.	T.B.D.
3 <sup>rd</sup> Change	T.B.D.	T.B.D.	T.B.D.	T.B.D.	T.B.D.
4 <sup>th</sup> Change	T.B.D.	T.B.D.	T.B.D.	T.B.D.	T.B.D.
5 <sup>th</sup> Change	T.B.D.	T.B.D.	T.B.D.	T.B.D.	T.B.D.

Qwertycoin community demanded Anti-Asic algorithm for the 1<sup>st</sup> change and the developers are committed to reflect the voices of the community to any changes in the future for possible algorithm changes.

If you want to mine QWC, please go to our explorer page (<https://explorer.qwertycoin.org/#pools>) and select a pool in which you want to mine. Each pool provides information and a guide to setup for mining. Users can also mine with CPU using a built-in mining feature in QWC Desktop Wallet Software.

Block rewards will be proportionally divided among supporting miners in each pool when the pool finds a block. After 60 block maturity, the rewards will be sent to your wallet address. Make sure to create a wallet address before you start mining QWC.

## Transition from EPoW to EPoS in QWC Network

---

QWC team realizes that it is inevitable that the main focus of blockchain algorithm has to shift from individual miners(EPoW) to competent node operators(EPoS) as more coins are mined towards QWC's maximum supply limit of 184.47 billion. It is because the block rewards decreases by each block and the energy consumption for EPoW mining becomes inefficient for the network.

As with any blockchain technologies, QWC block height will increase over time, which also results in the blockchain data file growing continuously in a linear trend. QWC's maximum block size is 1MB as of August 13th, 2018. With current block time of 120 seconds, QWC blockchain data file can grow 720MB per day, 21.6GB per month, 259.2GB per year.

Looking at computer storage market, it is important to note that 1TB SSD costs in the range of 220 USD to 300 USD depending on manufacturers. And with general

**\*\* Add Graph of Blockchain Size / Date**

**\*\* Appropriate Transaction Fee Table**

**\*\***

QWC blockchain network will lessen this load by allowing wallets to make remote connections to nodes, which stores

## **How to Get Coins [Masternode]: Egalitarian Proof of Service (EPoS – QWC Original)**

---

Again, the word egalitarian stands for providing equal rights and equal opportunities. It is free to run a QWC masternode since node reward program does not offer a staking option for providing a node. In order for nodes to receive rewards, a node must be setup and used as a remote daemon in wallet software. Based on the number of transactions processed in remote daemon connections, 10 QWC is rewarded per transaction. [June 29th, 2018]

QWC nodes perform following tasks in the network.

1. Holding transactions in the memory pool so that a miner can find a block with a group of these transactions
2. Verifying one-time ring signature of entire blockchain
3. Validating correct blockchain during a chain split from PoW
4. Propagating validated blockchain to all daemons running in our network

As QWC develops and brings more traffic to our network, the performance of these nodes will be very critical to our success for following reasons.

1. When blockchain size increases, it will take more time to synchronize with the network since desktop wallets are mostly not online.
2. Mobile wallets will always use a remote daemon feature since the data itself is quite

QWC team believes that the existing PoS reward system is not fair since the cost of running a node can be more than its rewards for the amount of work they provide to the network, and node information is currently not available when wallet users want to choose a remote daemon. In order to change this, QWC will implement EPoS system.

The new EPoS that Qwertycoint features is a reward program for node operators based on node's dedicated service time.

There are 3 components to make EPoS work.

1. Nodes, run by network participants
2. Sentinel, which checks the status of nodes periodically filters nodes based on conformance and performance criteria
3. Node Map, which shows geographical information of operating nodes
4. Network Explorer, which displays the network status of node and detailed information.

Sentinel provides API of online-node information after checking node's conformation to network requirements and the performance of its hardware and internet speed as well as 24-hour and lifetime uptime measurements to Network Explorer(NE). NE displays information from Sentinel to allow users to select desired nodes while having the ability to check the overall status of each node.

We call this measurement "Uptime", which uses UNIX time stamp.

EPoS reward system will be:

1. Rewards: accumulated transaction fees, which has been traditionally awarded to miners are switched to nodes. Depending on the current operation costs of nodes, this reward scheme will be adjusted when deemed necessary.
2. Reward Period: 24 hours UTC time

Again, EPoS is based on the concept of dedication in terms of conformance and performance of nodes to provide node functions to QWC network.

There will be several conformance and performance criteria of nodes of which the data will be identified/measured/stored/analyzed to determine which nodes are eligible for the rewards of accumulated transaction fees over a set period.

## **Blockchain Development Roadmap**

---

1. Stage 1: Currency Application Development (2017 – By the end of 2018)

- Daemon Development and Optimization
- CLI Wallet Development and Optimization
- Desktop Wallet Development and Optimization
- Mobile Wallet Development and Optimization
- Commerce Integration Development

2. Stage 2: Currency Ecosystem Development (2018 – Continuous)

- Invitation/Integration of Existing Commerce Applications
- Commerce Integration Optimization
- Patches and Updates for All Software

3. Stage 3:

Please check the current status of the roadmap from the official webpage.

## Exchange Listing and Pricing Strategies

---

The listing strategies for QWC are the followings:

- To have as many trading pairs as possible across multiple platforms
- To be listed in exchanges located in the major crypto trading
- Must be a verified business entity with a business registration with transparency and solid user base.

Decentralized	USA	Europe*	East Asia	S.E. Asia	Middle East	Africa	Crypto-based
		Crex24	OctaEx				

1. Octaex
2. Crepcoin
3. Crex24 - Funded by QWC Team
4. Altex – Free Listing
5. BitexLIVE – Funded by QWC Team

- A. Binance
- B. HitBTC
- C. Poloniex
- D. Upbit
- E. Bithumb
- F. StockExchange
- G. Yobit
- H. BiteBTC
- I.

## Future Application Developments

---

### Official Disclaimer

---

Qwertycoin is a public blockchain that is owned by the members of the community. Everyone is free to join the network without restrictions as long as they do not maliciously attack or abuse the network.

## CRYPTOCURRENCY ECOSYSTEM WITH QWERTYCOIN SYSTEM

---

### [C2C Transaction \(Coin to Coin Exchange Scheme\)](#)

Seller/Buyer -> Wallet (Transaction Fee) -> Individual Exchange (CEX/ DEX) & API-> C2C Exchange (Exchange Taker/Maker Fee)

to

Seller(Lender)/Buyer(Loaner) -> QwertyChat Wallet -> C2C Exchange based on Median Market Price from Multi-Exchange API (CEX / DEX)

1. Buyer(Loaner) initiates C2C exchange after confirming exchange rate and interest rate (ex. In QWC/BTC Pair, 0.0001 BTC/Hour->100,000 QWC/Hour) + transaction fee in QWC (100 QWC per transaction). This is recorded on a separate ledger.
2. Buyer(Loaner) sends coins to exchange address for C2C exchange. This is recorded on a separate ledger.
3. Once #2 action is confirmed, a group of Sellers(Lenders) accept C2C exchange by sending coins to Buyer(Loaner) wallet. This action is recorded on a separate ledger. A group of Sellers (Lenders) takes interests on the loan for the estimated duration of transaction time. At this time, A group of sellers will be selected to minimize risk and distribute interests.

Pro:

1. Buyers can receive the best market deal by taking the lowest sell order rate from Multi-Exchange API (CEX / DEX) at their fingertips.
2. Sellers can receive the best market deal by making the highest buy order rate from Multi-Exchange API (CEX / DEX) at their fingertips.

Con: Transaction within blockchain ledger can take a long time.

Remedy: To offset transaction delays, QWC loan will activate among its lumpsum accounts, providing immediate access to coins with a ledger. Lender accounts take interests for allowing immediate access to coins to Loaner during blockchain transaction time. **To hedge risk, the remaining coin value shall be larger than the loan volume and the withdrawal will be locked for the duration of required blockchain confirmations.** Transaction fee will be paid in QWC.

Q: What about the spread between the lowest sell order rate and the highest buy order rate?

#### [C2F / F2C Transaction \(Coin to Fiat / Fiat to Coin Exchange\)](#)

Seller -> Coin Wallet (Transaction Fee) -> Exchange -> C2F Exchange (Exchange Taker/Maker Fee)

Buyer -> Bank / Credit Card Account (Transaction Fee / Transaction Fee + Interest) -> Exchange -> C2F Exchange (Exchange Taker / Maker Fee)

to

#### [F2F Transaction \(Fiat to Fiat Exchange\) – USD, JPY, KRW, EUR, etc.](#)

Buyer/Seller -> Bank / Credit Card Account (Transaction Fee / Transaction Fee + Interest) -> F2F Exchange (Bank Exchange Fee)
